# Team/Project Info

## Project Title:

Chore Tracker

## Team Name:

Byte Squad

## Team Members:

Srujith Rao, Nithish Reddy, Vaidehi Joshi

### Reasons for Team Name:

Byte Squad was chosen as the team name to reflect the team's focus on technology and coding, symbolizing the collaborative effort of the team members in tackling coding challenges and delivering digital solutions. Additionally, "Byte" conveys a sense of precision and expertise in the digital realm, aligning well with the team's goals and objectives.

### Backend/Frontend Technologies:

Backend: Next.js, Supabase
Frontend: Next.js, React, Tailwind, HTML/CSS

### Specific Tasks per Person:

Nithish: Project management, UI/UX design oversight, Testing
Srujith: Database management, Security , Documentation
Vaidehi: Frontend/Backend development, Deployment

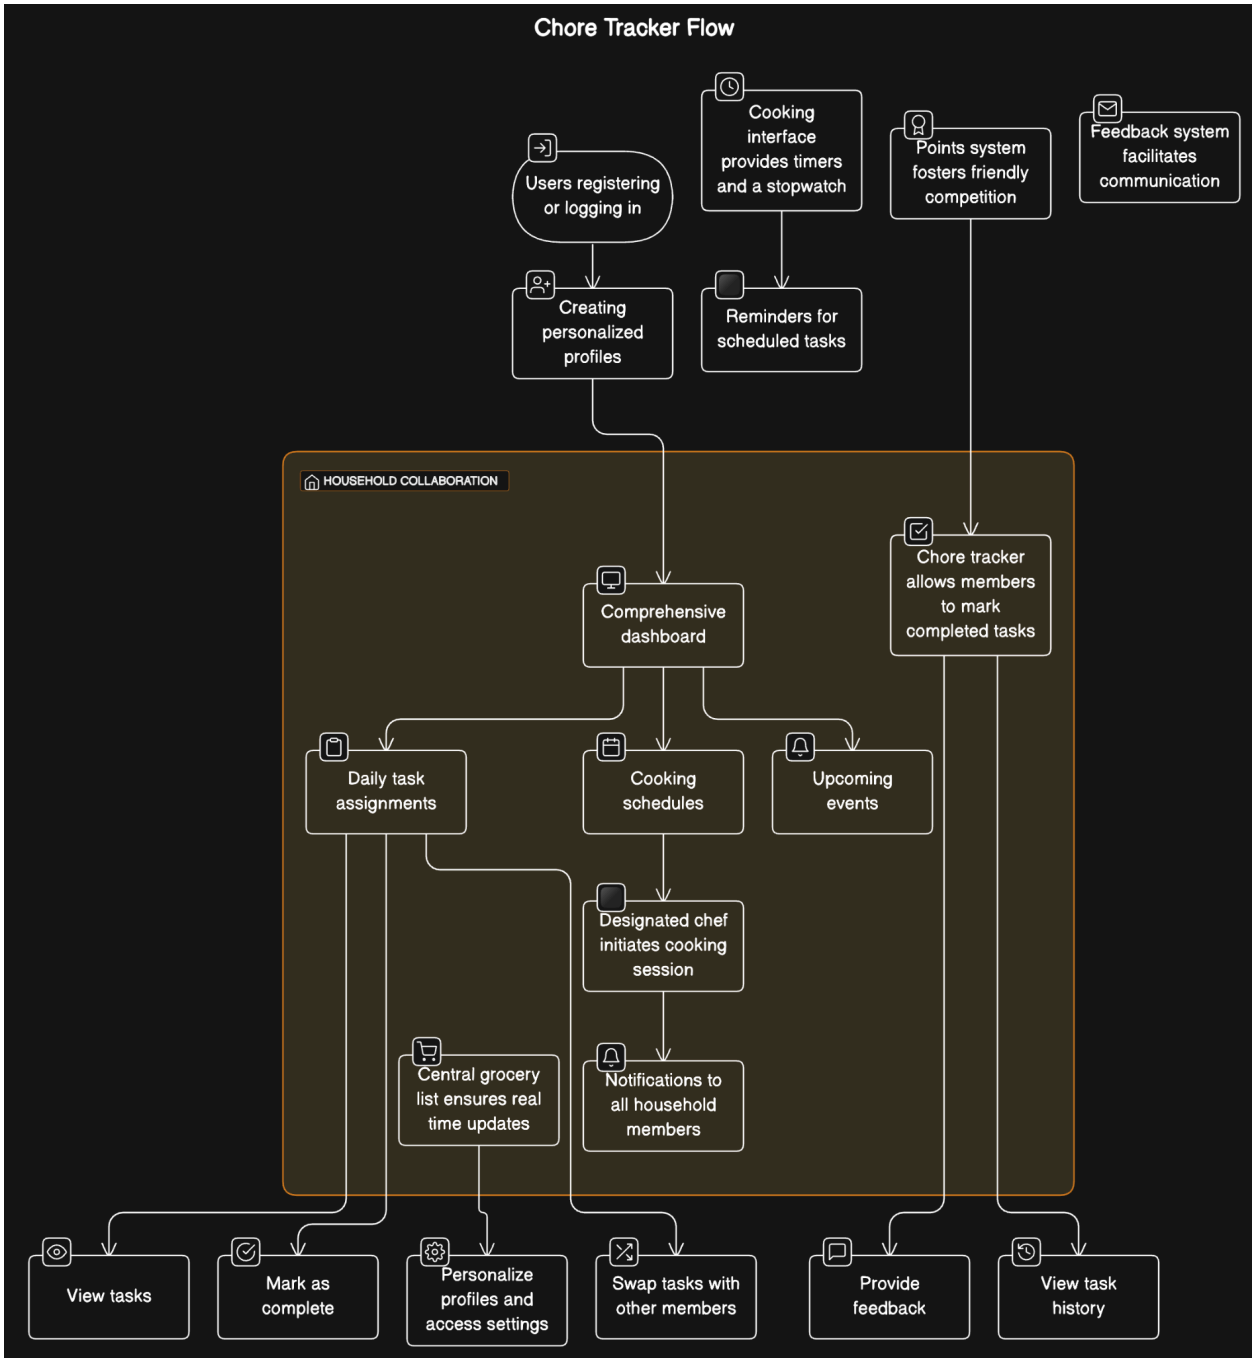
## Project Description

### Detailed Description:

Chore Tracker is a collaborative house chore management app designed for households. It utilizes Next.js for the frontend and Supabase for the backend. The app features a touch-friendly interface optimized for mounted tablets, making it easy for housemates to manage tasks, coordinate cooking, set reminders, track chores, and maintain a shared grocery list.

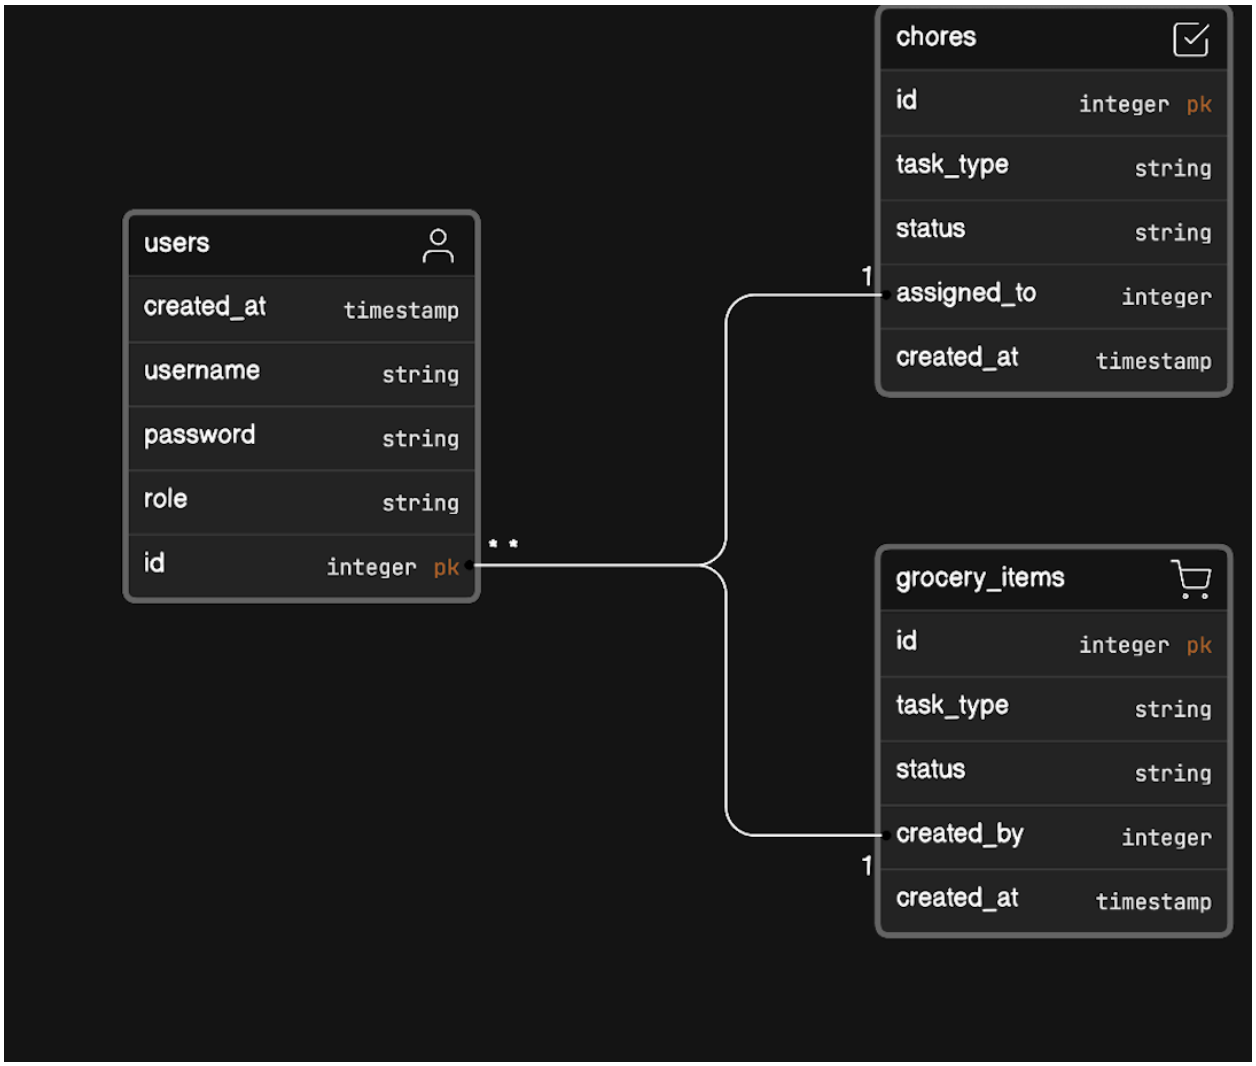
### Flowchart and ERD:

Flowchart:



Chore Tracker Flow
Users registering or logging in
Cooking interface provides timers and a stopwatch
Points system fosters friendly competition
Feedback system facilitates communication
Creating personalized profiles
Reminders for scheduled tasks
HOUSEHOLD COLLABORATION
Chore tracker allows members to mark completed tasks
Comprehensive dashboard
Daily task assignments
Cooking schedules
Upcoming events
Designated chef initiates cooking session
Central grocery list ensures real time updates
Notifications to all household members
View tasks
Mark as complete
Personalize profiles and access settings
Swap tasks with other members
Provide feedback
View task history

ERD:



## Algorithms/ML/AI Schemes:

The core engine primarily relies on user input and interaction algorithms for task assignment, reminders, and tracking. AI is not explicitly used in the core engine, but machine learning algorithms may be explored in future updates for better task prediction and optimization.

This algorithm facilitates efficient searching within the app's database for items.
Search Algorithm (for grocery items, tasks, etc.):
Linear search- O(n)
Binary Search - O(nlogn)

### Market Space and Selling Points:

Chore Tracker targets households and shared living spaces, offering a comprehensive solution for chore management. Its selling points include a user-friendly interface, seamless task assignment and tracking, real-time cooking updates, point-based rewards system, and collaborative grocery list management.

## Functional Specifications

### Product Features:

- Task Assignment: Assign and track daily tasks among housemates.
- Cooking Updates: Notify house members when cooking starts, providing details such as what's being cooked and estimated time.
- Timers/Stopwatch: Assist chefs with cooking tasks by providing timers and stopwatch features.
- Reminders: Set reminders for tasks and events.
- Points System: Award points based on completed tasks.
- Chore Tracker: Track chores and monitor progress.
- Grocery Section: Maintain a shared grocery list where users can add items to be bought.

### Multipuser Features:

- Chore Tracker supports multi user functionality by allowing users to collaborate on task assignment, track each other's progress, and contribute to the shared grocery list in real-time.

## Deployment

To deploy the Flask project:

- Sign up for a Heroku account and install the Heroku CLI.
- Create a new Heroku app using the Heroku CLI.
- Configure the app with required environment variables, such as database connection strings.
- Deploy the Flask project to Heroku using Git.

## Major Milestones:

Milestone 1 (M1): Initial setup and project scaffolding.
Milestone 2 (M2): Frontend development and UI/UX design.
Milestone 3 (M3): Backend development, database setup, and API integration.
Milestone 4 (M4): Testing, bug fixing, and deployment.
Milestone 5 (M5): Optimization, performance tuning, and additional feature implementation.

## Conclusion

Chore Tracker aims to streamline household chore management and foster cooperation among housemates. With its intuitive interface, real-time updates, and comprehensive feature set, it provides an efficient solution for managing tasks, cooking, reminders, points tracking, and grocery lists in shared living spaces.
